### **ABSTRACT OF THE DISCLOSURE**

10 A security architecture has been developed in which a single sign-on is provided  
for multiple information resources. Rather than specifying a single authentication  
scheme for all information resources, the security architecture associates trust-level  
requirements with information resources. Authentication schemes (e.g., those based on  
passwords, certificates, biometric techniques, smart cards, etc.) are associated with trust  
levels and a log-on service obtains credentials for an entity commensurate with the trust-  
15 level requirement(s) of an information resource (or information resources) to be accessed.  
Once credentials have been obtained for an entity and the entity has been authenticated to  
a given trust level, access is granted, without the need for further credentials and  
authentication, to information resources for which the authenticated trust level is  
sufficient.
